

RETAIL SALES PERFORMANCE

Storytelling Dashboard

(Excel → Power BI)

SCENARIO

A retail chain wants a clear, executive-friendly view of sales performance across regions, categories, and time. Management expects a story-driven dashboard to support decisions on promotions and inventory.

PROBLEM STATEMENT

Create a storytelling-driven analytics solution using Excel + Power BI that cleans sales data, summarizes insights, and presents an interactive performance dashboard with KPIs, trends, and actionable narrative.

PAIN POINTS

- Reports are static and not interactive
 - Sales data contains duplicates, missing values, inconsistent product names
 - Too many tables → hard to understand “what is driving performance”
 - Regional managers need drill-down capability (region → store → category)
-

EXPECTED OUTCOMES

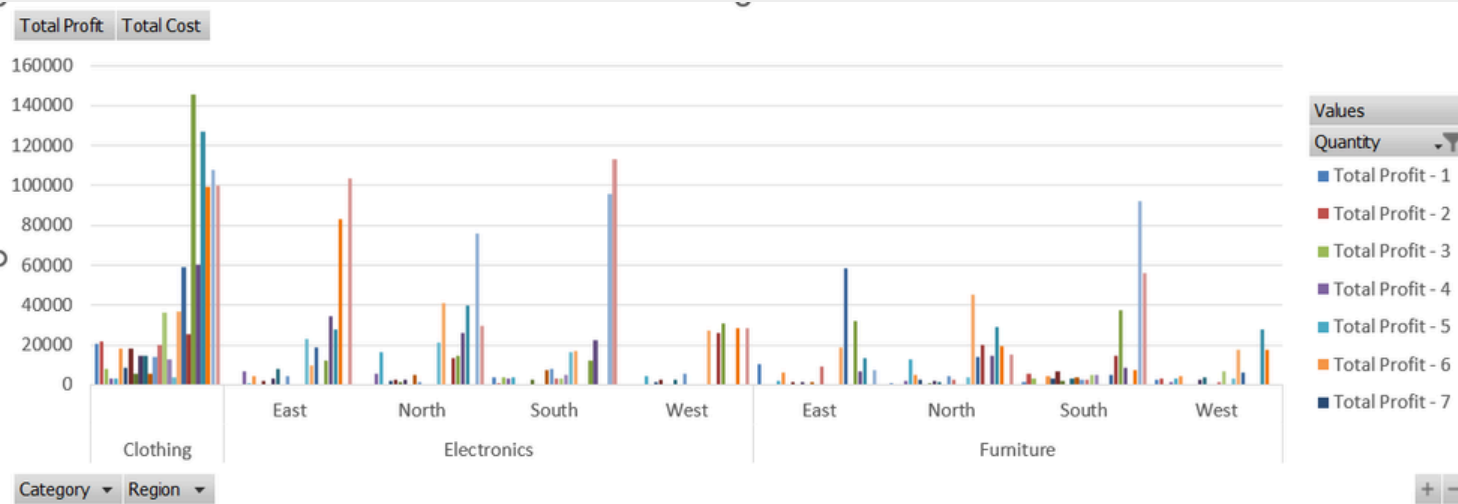

- Excel-based data cleanup (text-to-columns, remove duplicates, validation rules)
- PivotTables/PivotCharts and chart-based storytelling in Excel Power BI data model (star schema, relationships, cardinality, cross-filter direction)
- DAX KPIs: Total Sales, Profit %, MoM Growth, YoY Growth, Top Categories
- Interactive dashboard: slicers, drill-through, bookmarks, mobile layout
- Narrative insights using Smart Narrative + annotated visuals

PIVOT CHART

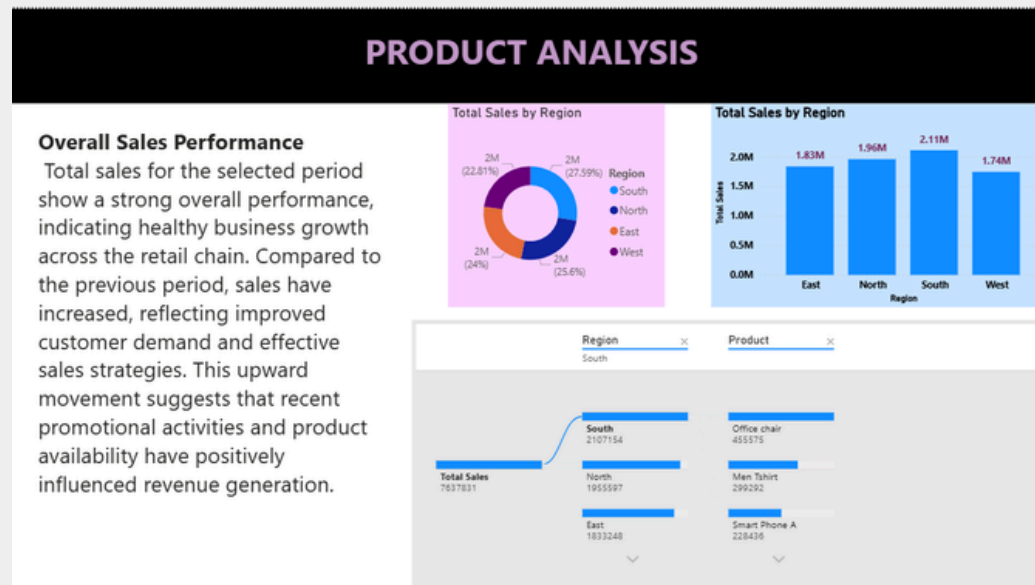

This chart compares Total Sales across Regions and Product Categories.

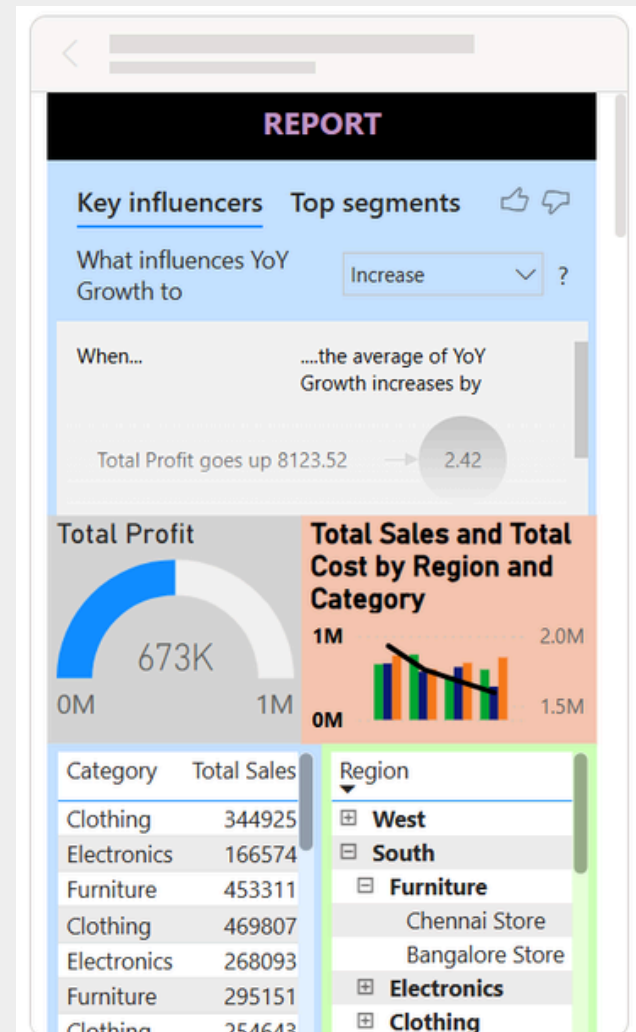

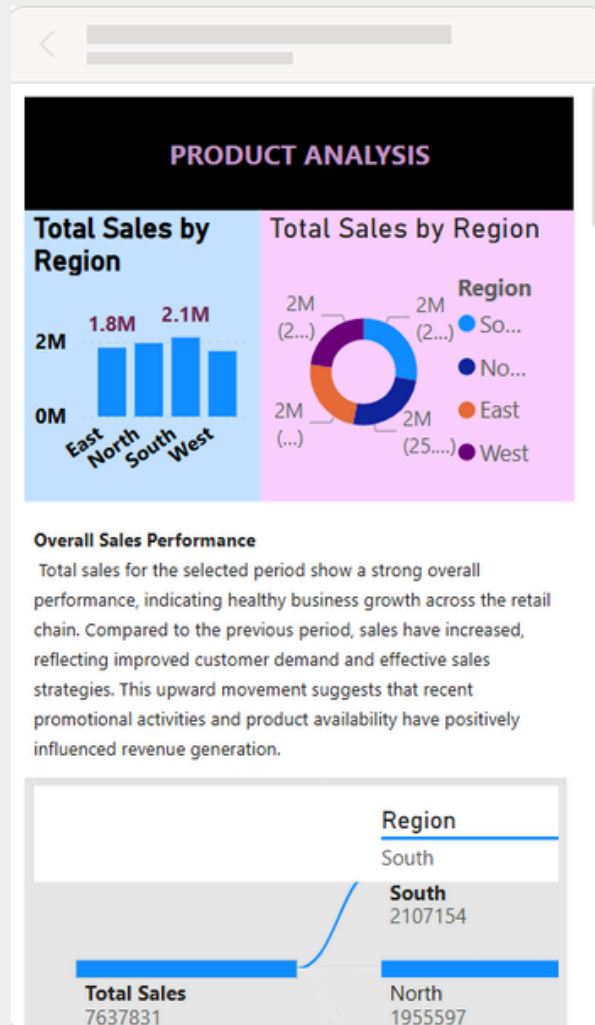

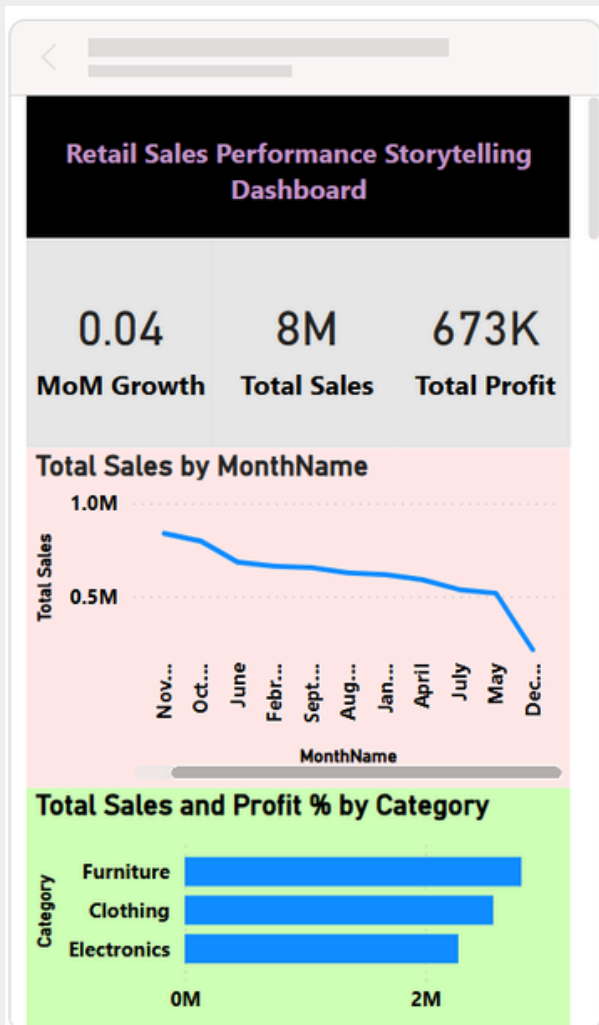

It helps identify:

- Which region generates the highest revenue
 - Which product category drives sales in each region
 - Performance variations across different regions
- The visualization supports decision-making for regional promotions and inventory planning.
